TITLE: Xylanase, DNA sequences, coding for the xylanases and methods of use thereof

Abstract Text (1):

The xylanase is characterized by several partial amino acid sequences and is immunoreactive with an antibody raised against a purified xylanase derived from Humicola insolens, DSM 1800. This xylanase preparation is practically free of cellulase xylanase and is well suited for treatment of paper pulp, as a baking agent and as an additive to fodder.

YEAR ISSUED (1):

1997

Brief Summary Text (5):

There are currently five major applications for xylanases; 1) enzymatic breakdown of agricultural wastes for production of alcohol fuels; 2) enzymatic modification of animal feeds or feed components or addition to animal feeds for in vivo breakdown of the hemicellulose fraction; 3) use as a baking agent; 4) manufacturing of dissolving pulps yielding cellulose; and 5) bio-bleaching of wood pulp. [Detroym R. W. In: Organic Chemicals from Biomass, (CRC Press, Boca Raton, Fla., 1981) 19-41.; Paice, M. G., and L. Jurasek. J. Wood Chem. Technol. 4: 187-198.; Pommier, J. C., J. L. Fuentes, G. Goma. Tappi Journal (1989): 187-191.; Senior, D. J., et al., Biotechnol. Letters 10 (1988):907-912.]

Brief Summary Text (12):

Humicola insolens xylanases have been described (Yoshioka, H. et al., Agric. Biol. Chem. 43(3) (1981) 579-586). In the crude preparation they have a pH-optimum of 6.0 and a temperature optimum of 60.degree. C. At pH 9 they show 25% of the activity at pH 6. According to the information in the article the enzymes were not purified and will therefore contain significant cellulase activity, as H. insolens is known as a good cellulase producer, reference being made to U.S. Pat. No. 4,435,307. Further the enzymes are not characterized with respect to cellulases. M.sub.w, pl or amino acid composition and has not been tested on kraft pulps, in baking or for animal feed.

Brief Summary Text (14):

Thus, it is the purpose of the invention to provide a xylanase, which can be produced as a preparation with very small amounts of other enzyme activities, especially cellulase activities and other xylanase activities, and which is well suited for use in delignification of kraft pulp, as a baking agent and as an additive to animal fodder.

Detailed Description Text (9):

Surprisingly, it has been found that it is possible to produce the \underline{xy} lanase according to the invention as part of a xylanase preparation, which contains enzymatic activities, e.g. cellulases besides xylanase in very small concentrations. Especially, it has to be noted that the xylanase according to the invention is a special xylanase selected among the several xylanases produced inherently from Humicola insolens, DSM 1800, which is excellently suited both as an agent for addition to paper pulp, as a baking agent and as an additive to animal fodder. Also, it has been found that the xylanase according to the invention exhibits a specific activity which is larger than the specific activity of any of the prior art xylanases. It is most surprising that the xylanase according to the

invention exhibits superior properties in relation to all these technical areas, which are otherwise unrelated to each other.

Detailed Description Text (14):

<u>Xylanase</u> (the designation pentosanase is commonly used in the <u>baking</u> industry) is used as a <u>baking</u> agent for wheat bread for several purposes:

Detailed Description Text (21):

The pH in dough is 6.0 to 5.5 which makes this $\underline{\text{xylanase}}$ ideal for the use as a $\underline{\text{baking}}$ agent, as the pH optimum of the $\underline{\text{xylanase}}$ according to the invention is 5.5 to 7.5.

<u>Detailed Description Text</u> (66):

Example 1 illustrates the selection of the $\underline{xylanase}$ producing gene and production of the $\underline{xylanase}$ by means of a genetic modified host organism. Example 2 illustrates the production in pilot plant of the $\underline{xylanase}$ and purification of the $\underline{xylanase}$. Example 3 illustrates the use of the $\underline{xylanase}$ as a bleach booster during paper pulp production and Example 4 illustrates the use of the $\underline{xylanase}$ as a baking agent.

Detailed Description Text (165):

This example illustrates the use of the <u>xylanase according to the invention as a baking</u> agent.

Detailed Description Text (166):

<u>Xylanase</u> (the designation pentosanase is commonly used in the <u>baking</u> industry) is used as a <u>baking</u> agent for wheat bread for several purposes:

Detailed Description Text (173):

The prior art <u>xylanase baking</u> agents comprise several enzymatic activities, whereas the <u>baking</u> agent according to the invention easily can be produced with a very low content of enzymatic activities other than the <u>xylanase</u> activity. Thus, by use of the <u>baking</u> agent according to the invention <u>bakery</u> products with more constant characteristics from one <u>baking</u> operation to the next <u>baking</u> operation can be obtained.

Detailed Description Text (181):

Pentopan.TM., a commercial preparation available from Novo Nordisk A/S, is a prior art baking agent which contains different xylanases from H. insolens and also other H. insolens enzyme activities. It appears from the above that the xylanase according to the invention has a better performance than the prior art baking agent as it provides larger volume and softer crumb. The most important baking advantage in relation to the xylanase according to the invention, in comparison to the prior art xylanase is the fact that the xylanase according to the invention can be used as a baking agent with practically no side activities, and thus is able to generate bread with very uniform properties from batch to batch.

CLAIMS:

30. A method for preparing a wheat bread, comprising \underline{baking} a wheat dough in the presence of a $\underline{xylanase}$ according to claim 1.
